Great Lakes Watershed field course

- National Oceanic and Atmospheric Administration (NOAA) B-WET grant

Next Generation Science Storylines

- Learn While Teaching Workshop - August 2017
- Better understanding of the Framework
- How can I make my classes more equitable?
- How do I create lessons where ALL students are part of the knowledge building?

Earth Force Framework

STEP 1: DISCOVER
COMMUNITY ENVIRONMENTAL
INVENTORY

Explore Anchoring
Phenomenon

Community Environmental Inventory

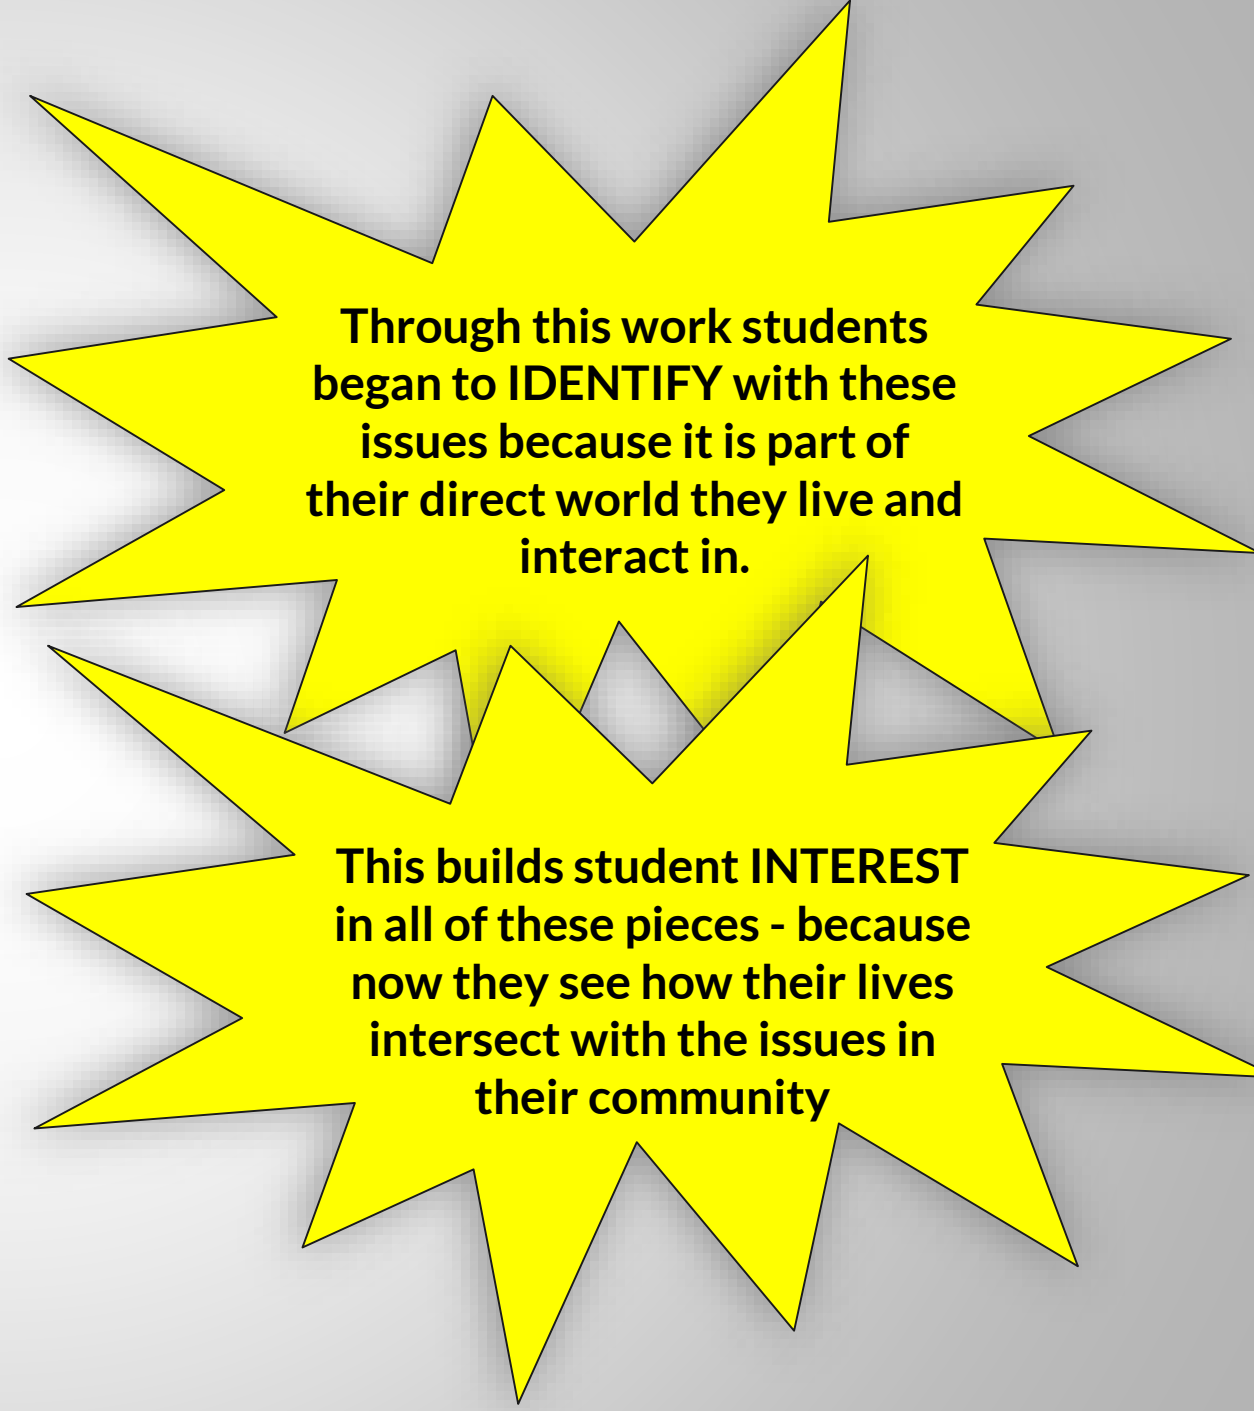

- Energy Audit
- Recycling Audit
- Environmental/Carbon footprint
- Food Waste Audit
- Guided Walking Tour
 - Pervious/Impervious Materials
 - Storm Water
 - Water Drainage
- Interviews
- Online Databases

Through this work students began to IDENTIFY with these issues because it is part of their direct world they live and interact in.

Community Environmental Inventory

- Energy Audit
- Recycling Audit
- Environmental/Carbon footprint
- Food Waste Audit
- Guided Walking Tour
 - Pervious/Impervious Materials
 - Storm Water
 - Water Drainage
- Interviews
- Online Databases

A large yellow starburst graphic with a black outline, containing two blocks of text. The starburst has multiple points of varying lengths and is centered on the right side of the slide.

Through this work students began to IDENTIFY with these issues because it is part of their direct world they live and interact in.

This builds student INTEREST in all of these pieces - because now they see how their lives intersect with the issues in their community

Community Environmental Inventory

- Energy Audit
- Recycling Audit
- Environmental/Carbon footprint
- Food Waste Audit
- Guided Walking Tour
 - Pervious/Impervious surfaces
 - Storm Water
 - Water Drainage
- Interviews
- Online Databases

... in the issue ... ir community

Community Environmental Inventory data discussion

Determined Community Strengths and Potential Issues (listed below) after completing the audits:

- Food waste in our cafeteria
- electricity/energy waste throughout the building
- lack of convenient recycling opportunities for both plastic and paper
- several areas on campus where water pooled
- lots of impervious surfaces that ran directly into the sewer
- a human-made pond that was in disrepair and covered in duckweed and algae
- a retention pond/drainage ditch that had been overrun by invasive species

STEP 1: DISCOVER
COMMUNITY ENVIRONMENTAL
INVENTORY

Issue Selection - Asking and Answering Initial Questions

- Determined list of initial questions that had to be addressed
 - Exploring cause and effect
 - Exploring assets and constraints involved
 - Does it meet the goal of improving watershed health?
- Groups presented potential projects to class

Issue Selection - Asking and Answering Initial Questions

- Determined list of initial questions that had to be addressed
 - Exploring cause and effect
 - Exploring assets and constraints involved
 - Does it meet the goal of improving watershed health?
- Groups presented potential projects to class

STEP 2: DECIDE
ISSUE SELECTION

Attempt to
Make Sense

Issue Selection - Consensus

The *Phragmites* infested retention pond

- has low biodiversity
- is not attracting pollinators
- is providing habitat for undesirable mammals (namely rats)
- dense reeds are trapping a lot of trash which was an eyesore and could cause other problems too
- Water is “dirty”

Project Goals

Student Goals

1. Improve watershed health
2. Increase biodiversity
3. Create opportunities for elementary and middle school students to have a local field trip where they learn about factors affecting the health of their local environment
4. Create opportunities for students (my AP students) to teach these concepts to the other students to raise awareness
5. Create outdoor space where students have place-based educational opportunities

Teacher Goals - Student Goals *PLUS*:

6. Prepare my students for the AP Environmental Exam by increasing their understanding of key content knowledge and science practices
7. Increase student awareness of careers and pathways to careers related to water quality
8. Increase the likelihood that students will think about the environment and become good environmental stewards and/or activists.
9. Increase student knowledge of how to approach community leaders and think about stakeholders when leading stewardship action projects
10. Increase the likelihood that students will choose to go outside for recreation

Students Identified Questions they still need to answer

What do we need to figure out to be able to do this?

- What plants do we want?
- Why do we need a pond there? What does it do? Where would the water go otherwise? What are all these big things that look like drains?
- Retention pond/rain garden design - How big will it have to be? Where is the water coming from and how much water enters after rain events?

How will they find the information?

Who will find the information?

Do we need permission to do this?

Students Identified Questions they still need to answer

What do we need to figure out to be able to do this?

- What plants do we want?
- **Why do we need a pond there? What does it do? Where would the water go otherwise? What are all these big things that look like drains?**
- Retention pond/rain garden design - How big will it have to be? Where is the water coming from and how much water enters after rain events?

How will they find the information?

Who will find the information?

Do we need permission to do this?

Planning and Taking Civic Action

Students formed task committees

- Soil type
- Native plant selection
- Equipment budget – determine best vendors
- Permitting for herbicide (do we need it?)
- Herbicide choice
- Methods removal and disposal
- Meeting with Superintendent for project approval
- Finding people in the community to help us learn and might help support our work

Planning and Taking Civic Action

Students formed task committees

- Soil type
- Native plant selection
- Equipment budget – determine best vendors
- Permitting for herbicide (do we need it?)
- Herbicide choice
- Methods removal and disposal
- Meeting with Superintendent for project approval
- **Finding people in the community to help us learn and might help support our work**

Who in the community can help us learn? What can we do to learn more AND to learn how to help others learn?

Who can help us learn about where the water is going?

- George Bednarski, Superintendent
Water and Sewer Department
Charter Township of Redford

Who can help us learn about how to know if our water is safe?

- Erin Cassady, Friends of the Rouge
Rouge Education Project

Who can help us learn about other parts of the watershed? How it is cleaned?
Different types of Wetlands?

- Daria Hyde and Yu Man Lee, Michigan
Natural Features Inventory and the Vernal
Pool Patrol

Developed a project timeline

- Herbicide treatment - no permit necessary (fall 2017)
- Start seeds in greenhouse (late winter/early spring 2018)
- Mechanical removal and/or controlled burn - sadly we did not get permission for burn (Spring 2018)
- Due to a late spring, removal began later than anticipated and we already had nesting red-wing blackbirds. 80% of the biomass was removed (Spring 2018)
- students agreed project would need an extended timeline
- Identification of new growth (Fall 2018)
- Field trips to help us learn about where the water goes
- Spot treatment for returning Phragmites (Fall 2018)
- Final Biomass Removal (Spring 2019)
- Partial planting and pilot field trip event (Spring 2019)

Developed a project timeline

- Herbicide treatment - no permit necessary (fall 2017)
- Start seeds in greenhouse (late winter/early spring 2018)
- Mechanical removal and/or controlled burn - sadly we did not get permission for burn (Spring 2018)
- Due to a late spring, removal began later than anticipated and we already had nesting red-wing blackbirds. 80% of the biomass was removed (Spring 2018)
- students agreed project would need an extended timeline
- Identification of new growth (Fall 2018)
- **Field trips to help us learn about where the water goes**
- Spot treatment for returning Phragmites (Fall 2018)
- Final Biomass Removal (Spring 2019)
- Partial planting and pilot field trip event (Spring 2019)

So many opportunities to learn AND to help!

Students expressed the need to learn more about biodiversity, wetlands and our watershed and wanted to be a part of more projects that could help.

https://www.youtube.com/watch?time_continue=4&v=ddlw9gmq6V4

Now that WE know, how do we help others learn?

- Maybe we could invite the 5th grade students from Addams?
- Hmmmm – that is interesting... What a coincidence... I've been helping some 5th grade teachers with a storyline unit called “Where does our clean water come from and where does it go after we make it dirty?”
- I bet they will love to learn from you guys and help with your project!

Students plan learning stations and garden layout then host learning stations for 5th graders

5th grade students help us plant the native plants

HS-ESS3-3. Create a computational simulation to illustrate the relationships among the management of natural resources, the sustainability of human populations, and biodiversity. [Clarification Statement: Examples of factors that affect the management of natural resources include costs of resource extraction and waste management, per-capita consumption, and the development of new technologies. Examples of factors that affect human sustainability include agricultural efficiency, levels of conservation, and urban planning.] [Assessment Boundary: Assessment for computational simulations is limited to using

HS-ESS3-4. Evaluate or refine a technological solution that reduces impacts of human activities on natural systems.* [Clarification Statement: Examples of data on the impacts of human activities could include the quantities and types of pollutants released, changes to biomass and species diversity, or areal

HS-ESS3-1. Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity. [Clarification Statement: Examples of key natural resources include access to fresh water (such as rivers, lakes, and groundwater), regions of fertile soils such as river deltas, and high concentrations of minerals and fossil fuels. Examples of natural hazards can be from interior processes (such as volcanic eruptions and earthquakes), surface processes (such as tsunamis, mass wasting and soil erosion), and severe climate patterns

lock, or surface reducing, reusing, filtering global

HS-LS1-2. Develop and use a model to illustrate the hierarchical organization of interacting systems that provide specific functions within multicellular organisms. [Clarification Statement: Emphasis is on functions at the organism system level such as nutrient uptake, water delivery, and organism movement in response to neural stimuli. An example of an interacting system could be an artery depending on the proper function of elastic tissue and smooth muscle to regulate and deliver the proper amount of blood within the circulatory system.] [Assessment Boundary: Assessment does not include interactions and functions at the molecular or chemical reaction level]

HS-LS2-2. Use mathematical representations to support and revise explanations based on evidence about factors affecting biodiversity and populations in ecosystems of different scales. [Clarification Statement: Examples of mathematical representations include finding the average, determining trends, and using graphical comparisons of multiple sets of data.] [Assessment Boundary: Assessment is limited to provided data.]

HS-LS2-6. Evaluate claims, evidence, and reasoning that the complex interactions in ecosystems maintain relatively consistent numbers and types of organisms in stable conditions, but changing conditions may result in a new ecosystem. [Clarification Statement: Examples of changes in ecosystem conditions could include modest biological or physical changes, such as moderate hunting or a seasonal flood; and extreme changes, such as volcanic eruption or sea level rise.]

HS-LS2-7. Design, evaluate, and refine a solution for reducing the impacts of human activities on the environment and biodiversity.* [Clarification Statement: Examples of human activities can include urbanization, building dams, and dissemination of invasive species.]

Science and Engineering Practices

Constructing Explanations and Designing Solutions

Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific knowledge, principles, and theories.

- Construct an explanation based on valid and reliable evidence obtained from a variety of sources (including students' own investigations, models, theories, simulations, peer review) and the assumption that theories and laws that describe the natural world operate today as they did in the past and will continue to do so in the future.

Science and Engineering Practices

Using Mathematics and Computational Thinking

Mathematical and computational thinking in 9–12 builds on K–8 experiences and progresses to using algebraic thinking and analysis; a range of linear and nonlinear functions including trigonometric functions, exponentials and logarithms; and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions.

- Create a computational model or simulation of a phenomenon, designed device, process, or system.
- Use mathematical representations of phenomena or design solutions to support

Science and Engineering Practices

Constructing Explanations and Designing Solutions

Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific knowledge, principles, and theories.

- Design or refine a solution to a complex real-world problem based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and tradeoff considerations.

Science and Engineering Practices

Constructing Explanations and Designing Solutions

Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific ideas, principles, and theories.

- Design, evaluate, and refine a solution to a complex real-world problem, based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and tradeoff considerations.

Science and Engineering Practices

Developing and Using Models

Modeling in 9–12 builds on K–8 experiences and progresses to using, synthesizing, and developing models to predict and show relationships among variables between systems and their components in the natural and designed worlds.

- Develop and use a model based on evidence to illustrate the relationships between systems or between components of a system.

Disciplinary Core Ideas

LS2.C: Ecosystem Dynamics, Functioning, and Resilience

- A complex set of interactions within an ecosystem can keep its numbers and types of organisms relatively constant over long periods of time under stable conditions.

Disciplinary Core Ideas

ESS3.C: Human Impacts on Earth Systems

The sustainability of societies and the biosphere depends on the management of natural resources. Human activities that support them require management of natural resources.

ESS3.C: Human Impacts on Earth Systems

- Scientists and engineers can contribute to solving problems by developing technologies that reduce pollution and prevent degradation.

Disciplinary Core Ideas

LS2.C: Ecosystem Dynamics, Functioning, and Resilience

- Moreover, anthropogenic changes (induced by human activity) in the environment—including habitat destruction, pollution, introduction of invasive species, overexploitation, and climate change—can disrupt an ecosystem and threaten the survival of some species.

Disciplinary Core Ideas

Ecosystem Dynamics, Functioning, and Resilience

A complex set of interactions within an ecosystem can keep its numbers and types of organisms relatively constant over long periods of time under stable conditions. If a modest disturbance to an ecosystem occurs, it may return to its more or less original state (i.e., the ecosystem is resilient) or it may become a very different system. Extreme fluctuations in the size of any population, however, can affect the functioning of ecosystems in terms of resource and habitat availability.

Organisms would have the capacity to produce populations of great size were it not for the fact that environments and resources are finite. This fundamental tension affects the abundance (number of individuals) of species in any given ecosystem.

Evaluating Possible Solutions

When evaluating solutions, it is important to take into account a range of constraints, including safety, reliability, and cost, and to consider the cultural, and environmental impacts.

Crosscutting Concepts

Systems and System Models

- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.

Connections to Engineering, Technology, and Applications of Science

Influence of Science, Engineering, and Technology on Society and the World

- Modern science, engineering, and technology have had a major influence on society and the world.

Crosscutting Concepts

Scale, Proportion, and Quantity

- Using the concept of orders of magnitude allows one to understand how a model at one scale relates to a model at another scale.

Crosscutting Concepts

Cause and Effect

- Empirical evidence is used to test a hypothesis about the relationship between cause and correlation and make claims about specific causes and effects.

Crosscutting Concepts

Stability and Change

- Much of science deals with constructing explanations of how things change and how they remain stable.

Crosscutting Concepts

Stability and Change

Change and rates of change can be identified and modeled over very short or long periods of time. Some system changes are irreversible.

Student Interest

Identity

Science and Engineering Practices
Constructing Explanations and Designing Solutions
Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific knowledge, principles, and theories.

- Construct an explanation based on valid and reliable evidence obtained from a variety of sources (including students' own investigations, models, theories, simulations, peer review) and the assumption that theories and laws describe the natural world operate the same as they did in the past and will continue to do so in the future.

Science and Engineering Practices
Using Mathematics and Computational Thinking
Mathematical and computational thinking in 9–12 builds on K–8 experiences and progresses to using algebraic thinking and analysis; a range of linear and nonlinear functions including trigonometric functions, exponentials and logarithms; and computational tools for statistical analysis, modeling, and simulation. Simple data analysis tools created by students are used.

Disciplinary Core Ideas
LS2.C: Ecosystem Dynamics, Functioning, and Resilience
• A complex set of interactions within an ecosystem can keep its numbers and types of organisms relatively constant over long periods of time under stable conditions.

Disciplinary Core Ideas
ESS3.C: Human Impacts on Earth Systems
The sustainability of societies and the land, water, and air that supports them requires management of natural resources.

ESS3.C: Human Impacts on Earth Systems
• Scientists and engineers can contribute to solving problems by developing technologies that reduce pollution and degradation.

Disciplinary Core Ideas
LS2.C: Ecosystem Dynamics, Functioning, and Resilience
• Anthropogenic changes (induced by human activity) in the environment—including construction, pollution, and climate change—can disrupt an ecosystem.

Disciplinary Core Ideas
LS2.C: Ecosystem Dynamics, Functioning, and Resilience
• A complex set of interactions within an ecosystem can keep its numbers and types of organisms relatively constant over long periods of time under stable conditions. If a modest disturbance to an ecosystem results in a physical disturbance to an ecosystem, it may return to its more or less stable state (i.e., the ecosystem is resilient). Extreme perturbations in an ecosystem, however, can result in a change in the system's availability.

Evaluating Possible Solutions
When evaluating solutions, it is important to take into account a range of constraints, including safety, reliability, and cost, and to consider the cultural, and environmental impacts.

Science and Engineering Practices
Constructing Explanations and Designing Solutions
Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific knowledge, principles, and theories.

- Design or refine a solution to a complex real-world problem based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and tradeoff considerations.

Science and Engineering Practices
Using Mathematics and Computational Thinking
• Design or refine a solution to a complex real-world problem, based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and tradeoff considerations.

Systems and Systems Models
• Models (e.g., diagrams, flowcharts, and computer models) represent interactions—such as material and information flows—within a system at different scales.

Crosscutting Concepts
Cause and Effect
• Empirical evidence is used to test and support or refute claims about specific causes and effects.

Crosscutting Concepts
Stability and Change
• Much of science deals with constructing explanations of how things change and how they remain stable.

Crosscutting Concepts
Scale, Proportion, and Quantity
• Understanding how a model at one scale relates to a model at another scale.

Crosscutting Concepts
Stability and Change
• Change and rates of change can be identified and modeled over very short or long periods of time. Some system changes are irreversible.

Thank you Dan - and thank you MWEA and MSTA for helping to make his vision a reality!

Work on this project was possible thanks to:

Lots of grant writing (and a some awards which bought also me a little “clout” with admin)!

- MWEA/MSTA Dan Wolz Clean Water Education Grant - \$1000
- Cornell Lab of Ornithology Garden Grant - \$1000
- Meemic Classroom Improvement Grant - \$300
- MAEOE Grant - \$500
- NOAA B-WET Grant (through Watershed Field Course) - \$300 plus extras
- Knight Center for Environmental Journalism Grant - \$1000 for Env Sci/\$1000 for video productions
- 2018 Michigan Lottery Excellence in Education Award - \$500
- NOAA Planet Stewards Education Project Grant – \$2500
- MDSTA Mini Grant - \$500
- Meemic Traditional Grant - \$500
- KidsGardening.org Budding Botanist Grant - \$3000
- Michigan Natural Features Inventory Healthy Watersheds grant - \$500
- MonachWatch.org/NRDC Green Gifts - Flat of Milkweed plugs
- 2019 MSTA Michigan High School Science Teacher of the Year
- 2019 NSTA Shell Science Teacher Award Semi-Finalist

Work on this project was possible thanks to:

Professional Learning opportunities provided by and in collaboration with:

- Northwestern University Science Storylines Team/NGSX Learn While Teaching Alpha Pathway
 - *Brian Reiser, Michael Novak, Tara McGill, Kelsey Edwards, Aliza Zivek, Trey Smith, Sarah Michaels (Clark University), Renee Affolter (Lead Instructor NGSX and Vermont Science Initiative), Deanna Bailey (NGSX) Trish Shelton (NSTA)*
- University of Colorado Boulder, Denver Public Schools and the iHub Team
 - *Bill Penuel, Katie VanHorn, Douglas Watkins*
- Inland Seas - Watershed Field Course
 - *Jeanie Williams and Chelsea Nestor*
- NOAA Planet Stewards Community
 - *Claire Lannoye-Hall, Bruce Moravchik, Molly Harrison*
- Michigan Natural Features Inventory
 - *Daria Hyde, Yu Man Lee, and Phyllis Higman*
- Rouge Education Project
 - *Erin Cassady*
- Earth Force
 - *Michelle Blodgett and Grace Scarsella*
- Cornell Lab of Ornithology
 - *Lyndsay Glasner and Kelly Schaeffer*
